# ESE 2025 : Mains Test Series

UPSC ENGINEERING SERVICES EXAMINATION

## Mechanical Engineering

Test-1 : Thermodynamics + Refrigeration  
and Air-conditioning + IC Engine

Name : .....

Roll No :

Test Centres			Student's Signature
Delhi <input checked="" type="checkbox"/>	Bhopal <input type="checkbox"/>	Jaipur <input type="checkbox"/>	
Pune <input type="checkbox"/>	Kolkata <input type="checkbox"/>	Hyderabad <input type="checkbox"/>	

Instructions for Candidates	
1.	Do furnish the appropriate details in the answer sheet (viz. Name & Roll No).
2.	There are Eight questions divided in TWO sections.
3.	Candidate has to attempt FIVE questions in all in English only.
4.	Question no. 1 and 5 are compulsory and out of the remaining THREE are to be attempted choosing at least ONE question from each section.
5.	Use only black/blue pen.
6.	The space limit for every part of the question is specified in this Question Cum Answer Booklet. Candidate should write the answer in the space provided.
7.	Any page or portion of the page left blank in the Question Cum Answer Booklet must be clearly struck off.
8.	There are few rough work sheets at the end of this booklet. Strike off these pages after completion of the examination.

FOR OFFICE USE	
Question No.	Marks Obtained
Section-A	
Q.1	30
Q.2	49
Q.3	-
Q.4	-
Section-B	
Q.5	04
Q.6	-
Q.7	28
Q.8	19
Total Marks Obtained	130

Signature of Evaluator

Cross Checked by

Gaurav Srivastava

## **IMPORTANT INSTRUCTIONS**

**CANDIDATES SHOULD READ THE UNDERMENTIONED INSTRUCTIONS CAREFULLY. VIOLATION OF ANY OF THE INSTRUCTIONS MAY LEAD TO PENALTY.**

### **DONT'S**

1. Do not write your name or registration number anywhere inside this Question-cum-Answer Booklet (QCAB).
2. Do not write anything other than the actual answers to the questions anywhere inside your QCAB.
3. Do not tear off any leaves from your QCAB, if you find any page missing do not fail to notify the supervisor/invigilator.
4. Do not leave behind your QCAB on your table unattended, it should be handed over to the invigilator after conclusion of the exam.

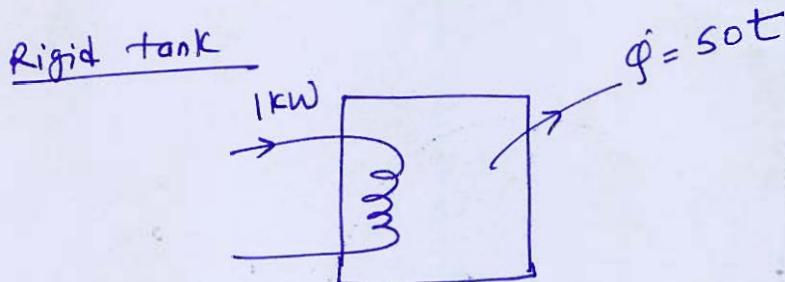

### **DO'S**

1. Read the Instructions on the cover page and strictly follow them.
2. Write your registration number and other particulars, in the space provided on the cover of QCAB.
3. Write legibly and neatly.
4. For rough notes or calculation, the last two blank pages of this booklet should be used. The rough notes should be crossed through afterwards.
5. If you wish to cancel any work, draw your pen through it or write "Cancelled" across it, otherwise it may be evaluated.
6. Handover your QCAB personally to the invigilator before leaving the examination hall.

## Section A : Thermodynamics + Refrigeration and Air-conditioning + IC Engine

- 1 (a) Helium gas is contained in a closed rigid tank. An electric resistor in the tank transfers energy to the gas at constant rate of 1 kW. Heat transfer from the gas to its surroundings occurs at a rate of  $50t$  watts, where  $t$  is time in seconds. Plot the change in energy of the helium in kJ, for  $t \geq 0$  and comment.

[12 marks]

by 1<sup>st</sup> law of thermodynamics

$$\delta Q = \frac{dU}{dt} + \delta W$$

$$-50t = \frac{dU}{dt} + (-1000)$$

$$\therefore -\frac{50}{1000}t = \frac{dU}{dt} - 1$$

$$\Rightarrow \frac{dU}{dt} = 1 - \frac{t}{20}$$

$$\Rightarrow dU = \left(1 - \frac{t}{20}\right) dt$$

on integrating both sides

$$U \Big|_0^U = t - \frac{t^2}{2 \times 20} \Big|_0^t$$

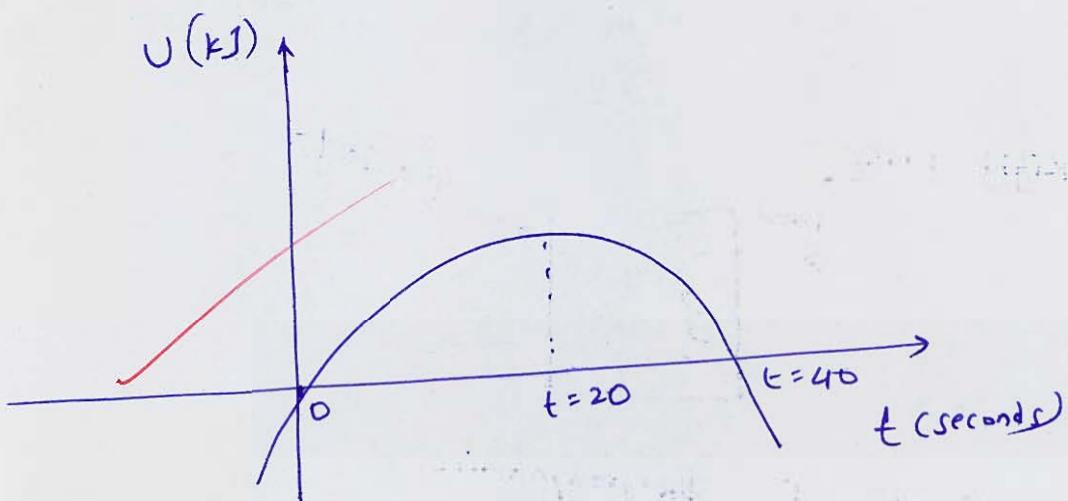

$$\Rightarrow U = t - \frac{t^2}{40}$$

$t$  is contained in a closed rigid tank

$$\therefore W=0$$

now,

$$U = t - \frac{t^2}{40} = t\left(1 - \frac{t}{40}\right)$$

$$t=0, U=0$$

$$t=40, U=0$$

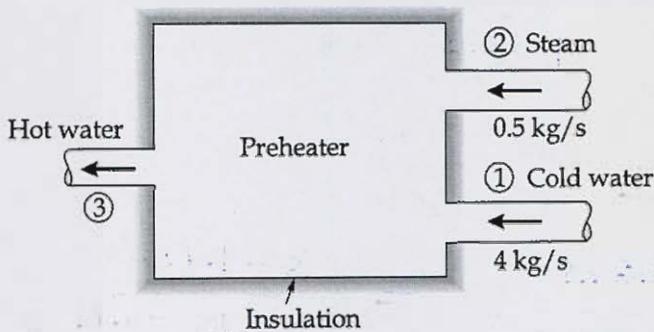

q  $\frac{dU}{dt} = 1 - \frac{t}{20} \rightarrow \boxed{t=20, \frac{dU}{dt}=0}$

$$\frac{d^2U}{dt^2} = -\frac{1}{20} < 0 \rightarrow \text{maximum}$$

→ from the graph, it can be said that energy of Helium reaches maximum at  $t=20$  second, becomes 0 at  $t=40$  second  
 q then keeps on decreasing.

(10)

- 1(b) A preheater is used to preheat water in a power plant cycle, as shown in the figure below. The super heated steam is at a temperature of 250°C and the entering water is subcooled at 45°C. All the pressures are 600 kPa. Calculate the rate of entropy generation. Is the process reversible or irreversible. Explain why? (Neglect kinetic and potential energy changes) [Use Steam Table attached at the end]

from steam table [12 marks]

1. for superheated steam at 250°C, 600 kPa  
 $h = 2957.6 \text{ kJ/kg}$     $s = 7.1832 \text{ kJ/kg K}$

2. for cold water at 45°C, 600 kPa  
 $h = 188.95 \text{ kJ/kg}$ ,    $s = 0.63836 \text{ kJ/kg K}$

Now,

3. for hot water  
mass flow rate,  $m_h = m_{\text{steam}} + m_{\text{cold water}}$   
 $= 0.5 + 4 = 4.5 \text{ kg/s}$

energy balance

$$m_h \cdot h = m_{\text{steam}} \cdot h_{\text{steam}} + m_{\text{cold water}} \cdot h_{\text{cold water}}$$

$$4.5 h = 0.5 \times 2957.6 + 4 \times 188.95$$

$$h_{\text{hot water}} = 496.577 \text{ kJ/kg}$$

so from steam table, for  $P = 600 \text{ kPa}$   
 $\underline{\quad \quad \quad h = 496.57 \text{ kJ/kg} \quad \quad }$

T	h	s
115°C	482.90	1.4733
120°C	503.45	1.5275

by interpolation

$$\frac{496.57 - 482.90}{504.09 - 482.90} = \frac{s - 1.4733}{1.5275 - 1.4733}$$

$$s = 1.5082 \text{ kJ/kg K}$$

now

$$\begin{aligned} \Delta S_{\text{entry}} &= m_{\text{steam}} s_{\text{steam}} + m_{\text{cold water}} s_{\text{cold water}} \\ &= 0.5 \times 7.1832 + 4 \times 0.63836 \\ &= 6.14504 \text{ kW/K} \end{aligned}$$

$$\begin{aligned} \Delta S_{\text{exit}} &= m_{\text{hot water}} s \\ &= 4.5 \times 1.5082 = 6.7869 \text{ kW/K} \end{aligned}$$

$$\begin{aligned} \dot{S}_{\text{gen}} &= \Delta S_{\text{exit}} - \Delta S_{\text{entry}} \\ &= 6.7869 - 6.14504 \end{aligned}$$

$$\boxed{\dot{S}_{\text{gen}} = 0.64186 \text{ kW/K}}$$

$\therefore \dot{S}_{\text{gen}} > 0$ , process is irreversible

(12)

.1 (c)

In the generator of an ammonia absorption refrigeration system, 10 kg of strong aqua solution at 82°C per minute is supplied for every kg of NH<sub>3</sub> driven out from the solution. The remaining weak solution leaves the generator at 100°C. Assuming the mass concentration of the aqua ammonia in the generator is 0.35.

- (i) Find the quantity of heat supplied from the external source per kg of NH<sub>3</sub> generated.
- (ii) The NH<sub>3</sub> generated in the generator is completely condensed to saturated liquid in the condenser and is completely evaporated in the evaporator. Using the P-h chart, find the ratio of refrigerating effect in the evaporator to the heat supplied in the generator per kg of NH<sub>3</sub>.

Assume the pressure in the evaporator is 2 bar.

If the flow of anhydrous ammonia through the evaporator is 8 kg/min, find the capacity of the system in tons of refrigeration.

- (iii) Compare the refrigerating effect produced from the amount of heat given to the generator is utilised in vapour-compression system working in the same pressure limit and having the same conditions of refrigerant in the inlet and outlet of the evaporator. Assume the compression machine of vapour compression system is driven by a prime-mover which has a thermal efficiency of 10%.

Assume the compression in the compressor is isentropic and transmission efficiency between the prime-mover and compressor is 100%.

Take the following data: Pressure in the generator = 10 bar. Enthalpy of NH<sub>3</sub> leaving the generator = 1860 kJ/kg

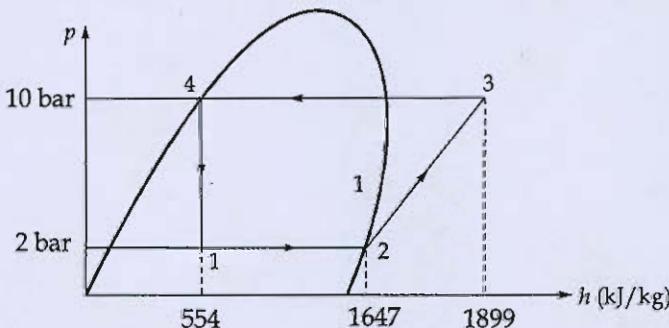

Mean specific heat of solution = 4.78 kJ/kg·°C

Heat loss from the generator to atmosphere = 79 kJ/kg of NH<sub>3</sub> generated.

Take the heat of aqua ammonia = 418 kJ/kg at 0°C

Use the following equation for the heat of absorption:

$$Q_a = 802.5(1 - x_w) - 928x_w^2, \text{ where } x_w \text{ is the mean mass concentration of aqua ammonia.}$$

[12 marks]

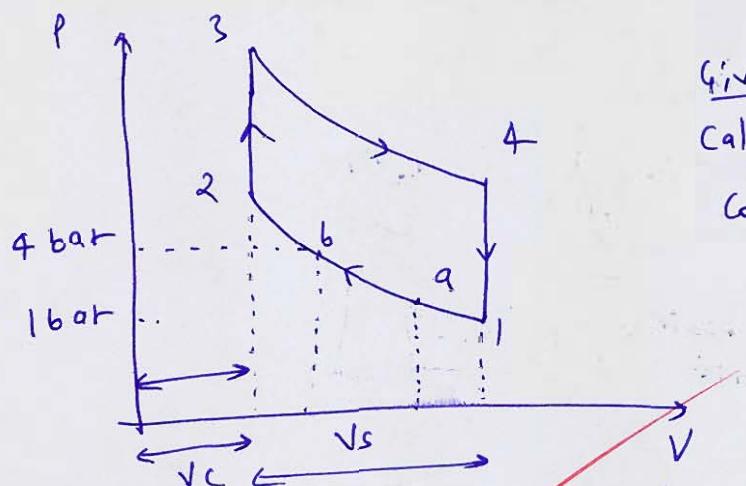

**Q.1 (d)**

Explain how does a complete HVAC system work to meet the heating, ventilating and air conditioning requirements of a large complex?

**[12 marks]**

- 1 (e) A petrol engine is supplied with fuel having calorific value 42000 kJ/kg. The pressure in the cylinder at 10% and 80% of the compression stroke are 1 bar and 4 bar respectively. Assume that the compression follows the law  $PV^{1.3} = \text{constant}$ . Find the compression ratio of the engine. If the relative efficiency of the engine compared with the air standard efficiency is 75%, then calculate the indicated specific fuel consumption in kg/kWh.

[12 marks]

Given:Calorific Value,  $C_V = 42000 \frac{\text{kJ}}{\text{kg}}$ Compression  $\rightarrow PV^{1.3} = C$ 

$$V_a = V_c + \frac{90}{100} V_s = V_c + 0.9 V_s, \quad P_a = 1 \text{ bar}$$

$$V_b = V_c + \frac{20}{100} V_s = V_c + 0.2 V_s, \quad P_b = 4 \text{ bar}$$

$$\therefore PV^{1.3} = C$$

$$\Rightarrow P_a V_a^{1.3} = P_b V_b^{1.3}$$

$$1. [V_c + 0.9 V_s]^{1.3} = 4 [V_c + 0.2 V_s]^{1.3}$$

or

$$\frac{V_c + 0.9 V_s}{V_c + 0.2 V_s} = 4^{\frac{1}{1.3}}$$

or

$$\frac{\frac{V_c}{V_s} + 0.9 \frac{V_s}{V_s}}{\frac{V_c}{V_s} + 0.2 \frac{V_s}{V_s}} = 2.90484$$

$\therefore \frac{V_c}{V_s} = c$  = clearance ratio

$$\Rightarrow \frac{c+0.9}{c+0.2} = 2.90484$$

or

$$c+0.9 = 2.90484 c + 0.58096$$

$$\Rightarrow C = 0.1675$$

$\Rightarrow$  compression ratio,

$$r = 1 + \frac{1}{c} = 1 + \frac{1}{0.1675} = 6.97$$

Ans. Compression ratio,  $r = 6.97$

for air SFC  
efficiency ↑  
↑ take

now, air standard efficiency =  $1 - \frac{1}{r^{n-1}} = 1 - \frac{1}{6.97^{1.3-1}}$

$$= 0.4415$$

relative efficiency = 75% of  $\eta_{air-standard}$

$$= 0.75 \times 0.4415 \\ = 0.3311$$

i.e.  $\frac{\text{Indicated Power}}{m_{\text{fuel}} \times 42000} = 0.3311$

$$\Rightarrow \frac{m_{\text{fuel}}}{I.P.} = \frac{1}{42000 \times .3311} \times 3600$$

*Check Calculation*

$$\frac{m_{\text{fuel}}}{I.P.} = 0.906 \text{ kg/kWth}$$

i.e. indicated specific fuel consumption  $= 0.906 \text{ kg/kWth}$

Ans.

2 (a) A frictionless piston cylinder arrangement is loaded with a linear spring, having spring constant 100 kN/m and the piston cross-sectional area is 0.1 m<sup>2</sup>. The cylinder initial volume of 20 L contains air at 200 kPa and 10°C. The cylinder has a set of stops that prevent its volume exceeding 50 L. A valve connects to a line flowing air at 800 kPa, 50°C. The valve is now opened, allowing air to flow in until the cylinder pressure reaches 800 kPa, at this point the temperature inside the cylinder is 80°C. The valve is then closed and the process ends.

- Is the piston at the stops at the final state?
- Taking the inside of the cylinder as a control volume calculate the heat transfer during the process.
- Calculate the net entropy change for this process.

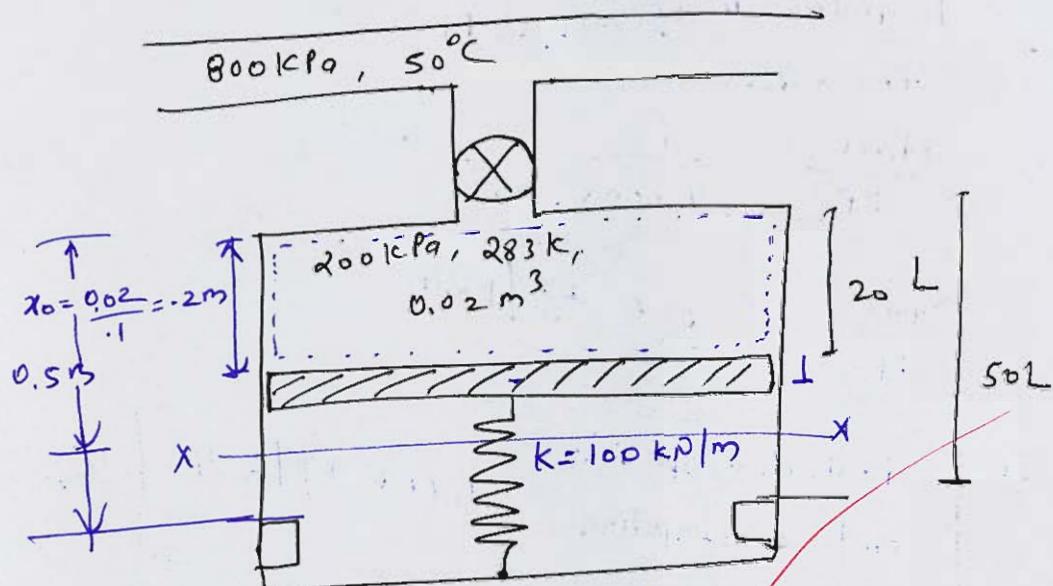

Neglect the mass of the piston.

[For air, take  $c_p = 1.005 \text{ kJ/kgK}$ ,  $c_v = 0.718 \text{ kJ/kgK}$ ,  $R = 0.287 \text{ kJ/kgK}$ ]

[20 marks]

Given:

spring constant,  $K = 100 \text{ kN/m}$   
 piston area,  $A = 0.1 \text{ m}^2$   
 initial volume of cylinder,  $V_1 = 20 \text{ L} = 20 \times 10^{-3} \text{ m}^3$   
 initial pressure,  $P_1 = 200 \text{ kPa}$   
 initial temperature,  $T_1 = 10^\circ\text{C} = 283 \text{ K}$

initial mass of air inside cylinder,

$$m_i = \frac{P_i V_i}{R T_i} = \frac{200 \times 0.02}{0.287 \times 283} = 0.04925 \text{ kg}$$

$\therefore$  spring is linear, at equilibrium at instance  $x$ ,

$$P A = k(x - x_0) \quad \text{--- (a)}$$

$\Rightarrow P \propto x$  → linear variation of pressure

now,

$$\frac{dm}{dt} = m_i - m_i e^{-\frac{x}{x_0}} = m_i \quad \text{--- (1)}$$

energy conservation (neglecting KE & PE changes)

$$\frac{dU}{dt} = m_i h_i + \dot{q} - m_i h_e - \dot{w}$$

$$\Rightarrow \boxed{\frac{dU}{dt} = \frac{dm}{dt} \cdot h_i + (\dot{q} - \dot{w})} \quad \text{--- (2)}$$

now,

$\Rightarrow$  final condition inside cylinder,

$$P_2 = 800 \text{ kPa}, \quad T_2 = 80^\circ\text{C} = 80 + 273 = 353 \text{ K}$$

$\Rightarrow$  from eqn (2)

$$CV \left[ \frac{dm}{dt} T \right] = \frac{dm}{dt} h_i + (\dot{q} - \dot{w}) \quad \text{--- (3)}$$

$\therefore$  from eqn (2)

$$PA = kx$$

at 1  $200 A = k x_1$

$$\text{at } 1 \quad 200 \times 0.1 = 100 \times 10^3 \quad x_1$$

$$\boxed{x_1 = 2 \times 10^{-4} m}$$

$$\boxed{x_1 = 0.2 m}$$

at 2  $800 A = 100 x_2$

$$800 \times 1 = 100 x_2 \rightarrow \boxed{x_2 = 0.8 m}$$

$x_2 - x_1 = 0.6 m \Rightarrow$  piston is at the stops Ans

final volume,  $V_2 = 50L = 0.05 m^3$

$$\text{so, final mass, } m_2 = \frac{P_2 V_2}{R T_2} = \frac{800 \times 0.05}{287 \times 353} = 0.39482 \text{ kg}$$

so, from eqn (3)

$$C_V [d(mT)] = C_p T_i dm + (\dot{Q} - \dot{W}) dt$$

on integrating both sides.

$$C_V [m_2 T_2 - m_1 T_1] = C_p T_i (m_2 - m_1) + (\dot{Q} - \dot{W})$$

on putting values

$$0.718 \left[ 0.39482 \times \frac{353}{0.04925} - 0.04925 \times 283 \right]$$

$$= 1.005 \times (50+273) (0.39482 - 0.04925) + (\dot{Q} - \dot{W})$$

$$\Rightarrow \boxed{\dot{Q} - \dot{W} = -22.116 \text{ kJ}} \quad (4)$$

now, for linear spring system

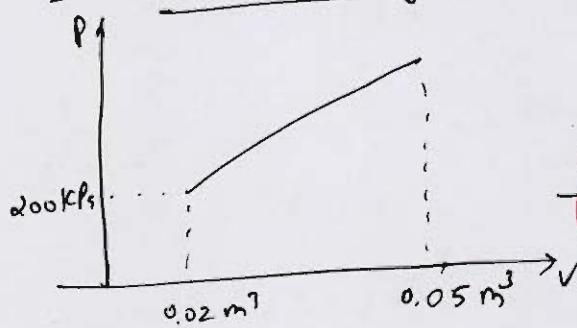

$$W = \frac{1}{2} (P_1 + P_2) (V_2 - V_1)$$

$$= \frac{1}{2} (200 + 800) (0.05 - 0.02)$$

$$\boxed{W = 15 \text{ kJ}}$$

500

10.5 kJ

so from eqn (9)

$$\dot{Q} = -22.116 + 15 = -7.116 \text{ kJ}$$

Ans

### 3. Net entropy change

$$\Delta S_{\text{initial}} = m_i \left[ C_p \ln \frac{T_2}{T_1} - R \ln \frac{P_2}{P_1} \right] =$$

$$= 0.04925 \left[ 1.005 \ln \frac{80+273}{10+273} - 0.287 \ln \frac{800}{200} \right]$$

$$= -8.6552 \times 10^{-3} \text{ kJ/K}$$

$$\Delta S_{\text{entered}} = m_{\text{entered}} \left[ C_p \ln \frac{T_2}{T_1} - R \ln \frac{P_2}{P_1} \right]$$

$$= (0.39482 - 0.04925) \left[ 1.005 \ln \frac{80+273}{50+273} - 0.287 \ln \frac{800}{800} \right]$$

$$= 0.030845 \text{ kJ/K}$$

$$\Delta S_{\text{net}} = \Delta S_{\text{initial}} + \Delta S_{\text{entered}} = -8.6552 \times 10^{-3} + 0.030845$$

$$\Delta S_{\text{net}} = 0.222 \text{ kJ/K}$$

Ans!

Q.2 (b)

A R-12 vapour compression system includes a liquid vapour heat exchanger in the system. A system of 80 kW refrigeration capacity operates between  $-8^{\circ}\text{C}$  and  $42^{\circ}\text{C}$  respectively. Refrigerant is subcooled by  $5^{\circ}\text{C}$  before entering the throttle valve and superheated by  $10^{\circ}\text{C}$  before entering the compressor. If a two-cylinder single acting reciprocating compressor with bore to stroke ratio of 1 : 1.4 operates at 1250 rpm then, determine the following

- COP of the system
- Mass flow rate of refrigerants
- Theoretical piston displacement per minute
- Bore and stroke of the compressor

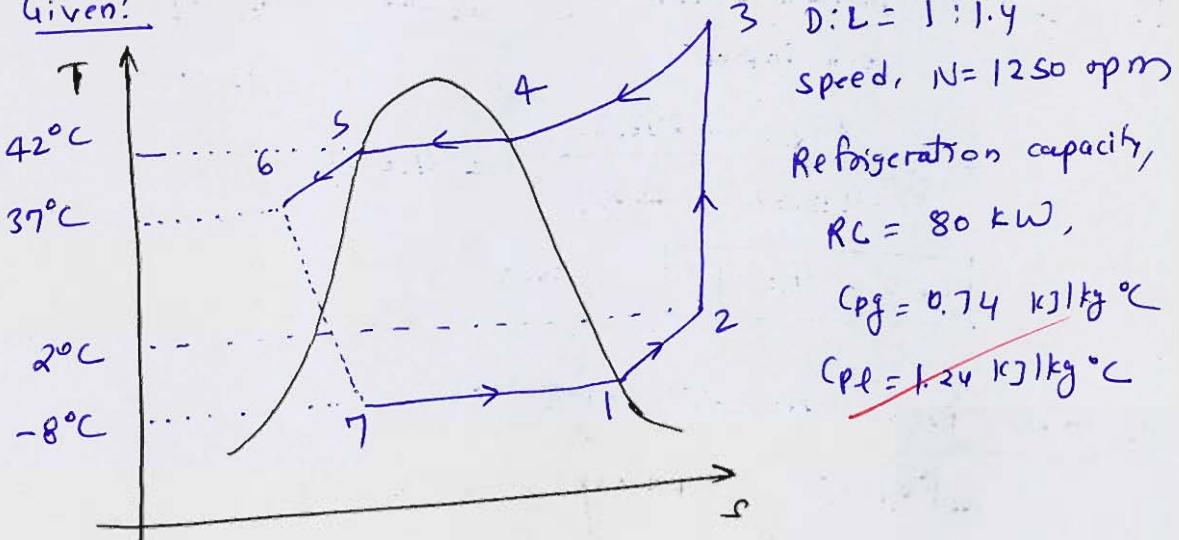

Assume volumetric efficiency of the compressor = 85%

Take  $C_{pl} = 1.24 \text{ kJ/kg}^{\circ}\text{C}$  and  $C_{pg} = 0.74 \text{ kJ/kg}^{\circ}\text{C}$  for R-12

Use the following properties of R-12

Temp. ( $^{\circ}\text{C}$ )	Enthalpy (kJ/kg)		Entropy kJ/kg-K		Specific volume ( $\text{m}^3/\text{kg}$ )	
	Liquid	Vapour	Liquid	Vapour	Liquid	Vapour
-8	190.7	402.3	0.966	1.764	$0.76 \times 10^{-3}$	0.064
+42	252.4	416.8	1.175	1.697	$0.89 \times 10^{-3}$	0.014

[20 marks]

Given:

now,  $h_1 = h_g @ -8^{\circ}\text{C} = 402.3 \text{ kJ/kg}$

~~$h_2 = h_1 + c_{pg} \Delta T = 402.3 + 0.74 \times 10 = 409.7 \text{ kJ/kg}$~~

~~$s_1 = s_g @ -8^{\circ}\text{C} = 1.764 \text{ kJ/kg-K}$~~

~~$$s_2 = s_1 + c_{pg} \ln \frac{T_2}{T_1} = 1.764 + 0.74 \ln \frac{273}{-8+273}$$~~

$$= 1.79141 \text{ kJ/kg-K}$$

now assuming 2-3 to be isentropic compression

~~$$s_2 = s_3 = s_4 + c_{pg} \ln \frac{T_3}{T_4}$$~~

~~$$\Rightarrow 1.79141 = 1.697 + 0.74 \ln \frac{73}{42+273}$$~~

$$\boxed{73 = 357.864 \text{ K}}$$

~~$$\Rightarrow h_3 = h_4 + c_{pg} (T_3 - T_4)$$~~

$$= 416.8 + 0.74 [357.864 - (273+42)]$$

$$\boxed{h_3 = 448.52 \text{ kJ/kg}}$$

~~$$h_5 = h_f @ 42^{\circ}\text{C} = 252.4 \text{ kJ/kg}$$~~

$$h_6 = h_5 - c_{pl} \Delta T = 252.4 - 1.24 \times 5$$

$$\boxed{h_6 = 246.2 \text{ kJ/kg} = h_7}$$

$$1. \text{ COP} = \frac{\text{Desired effect}}{\text{work input}} = \frac{h_2 - h_3}{h_1 - h_2}$$

$$= \frac{402.3 - 246.2}{448.52 - 409.7} = 4.02$$

COP = 4.02

Ans:

2. mass flow rate of refrigerant

Refrigeration capacity = 80 kW

$$\dot{m}_{ref} (h_1 - h_2) = m_{ref} (402.3 - 246.2) = 80$$

~~$\dot{m}_{ref} = 0.5125 \text{ kg/s}$~~

Ans:

3. Theoretical piston displacement per minute (Vs)

$$V_s = \frac{\pi}{4} D^2 L N \times k$$

now,  $V_1 = V_2 @ -8^\circ\text{C} = 0.064 \text{ m}^3/\text{kg}$

2 1-2 is constant pressure process

$$\Rightarrow \frac{V_1}{V_2} = \frac{T_1}{T_2}$$

$$\Rightarrow \frac{0.064}{V_2} = \frac{-8 + 273}{2 + 273}$$

$V_2 = 0.066415 \text{ m}^3/\text{kg}$

$$\Rightarrow \text{Vol} = \frac{\dot{m}_{ref} \times V_2}{V_s}$$

$$0.85 = \frac{0.5125 \times 0.066415}{V_s}$$

$V_s = 0.04 \frac{\text{m}^3}{\text{s}} = 2.4 \frac{\text{m}^3}{\text{min}}$

Ans!

4.  $V_s = \frac{\pi}{4} D^2 L N \times K$

$$2.4 = \frac{\pi}{4} \times D^2 \times 1.4D \times 1250 \times 2$$

$$\Rightarrow D = 0.09557 \text{ m} = 95.576 \text{ mm}$$

$$L = 1.4D = 133.8 \text{ mm}$$

Ans!      Bore,  $D = 95.576 \text{ mm}$       Ans!  
stroke,  $L = 133.8 \text{ mm}$

18P2

- 2.2 (c) A four cylinder four stroke SI engine has a bore of 50 mm and stroke of 70 mm. It runs at 3200 rpm and is tested at this speed against a brake which has a torque arm of 0.35 m. The net brake load is 150 N and the fuel consumption is 6 litre per hour. The specific gravity of the fuel used is 0.78 and it has a lower calorific value of 44000 kJ/kg. A morse-test is carried out and the cylinders are cut out in the order 1, 2, 3 and 4 with the corresponding brake loads of 100, 95, 98, 104 N respectively.

For this speed calculate

- (i) Brake power
- (ii) Brake mean effective pressure (bmep)
- (iii) Brake thermal efficiency and Brake specific fuel consumption (bsfc)
- (iv) Indicated power
- (v) Mechanical efficiency and Indicated mean effective pressure (imep)

Given: four cylinder four stroke SI engine [20 marks]

$$N = 3200 \text{ rpm}$$

$$\text{torque arm, } r = 0.35 \text{ m}$$

$$\text{net brake load, } f_b = 150 \text{ N}$$

$\Rightarrow$  Brake power, ~~from all~~ from all 4 cylinder

$$4BP = f_b \times r \times \frac{2\pi N}{60} = 150 \times 0.35 \times \frac{2 \times \pi \times 3200}{60}$$

Brake power  $\rightarrow$   $4BP = 17.593 \text{ kW}$  Ans!

Now, Brake loads after cut out each cylinder  
( in the order 1, 2, 3, 4 ) is 100, 95, 98, 104 N

$\Rightarrow$  avg Brake load from 3 cylinder at a time

$$3F_{b,\text{avg}} = \frac{100 + 95 + 98 + 104}{4} = 99.25 \text{ N}$$

$\Rightarrow$  Brake torque from 3 cylinder at a time

$$\begin{aligned} 3BP &= 3F_{b,\text{avg}} \times r \times \frac{2\pi N}{60} \\ &= 99.25 \times .35 \times \frac{2 \times \pi \times 3200}{60} = 11.64 \text{ kW} \end{aligned}$$

$$3BP = 11.64 \text{ kW}$$

$$\Rightarrow \text{Indicated power} = 4 \times [4B - 3B]$$

$$= 4 \times [17.593 - 11.64]$$

Indicated power	$= 23.812 \text{ kW}$	Ans!
-----------------	-----------------------	------

now, Brake thermal efficiency

$$\eta_{bth} = \frac{BP}{Heat \text{ supp.}} = \frac{11.64}{m_f \times 44000} \times 100$$

$\therefore$  Specific gravity of fuel = 0.78

$$\Rightarrow \rho_{fuel} = 0.78 \times 1000 = 780 \text{ kg/m}^3$$

$$\& \therefore V_{fuel} = 6 \text{ litre/hr} = \frac{6 \times 10^{-3}}{3600} \text{ m}^3/\text{h}$$

$$\Rightarrow m_{fuel} = \rho_{fuel} \times V_{fuel} = 780 \times \frac{6 \times 10^{-3}}{3600}$$

$$m_{fuel} = 1.3 \times 10^{-3} \text{ kg/s}$$

$$\Rightarrow \eta_{bth} = \frac{11.64}{1.3 \times 10^{-3} \times 44000} \times 100 = 30.757 \%$$

$$\eta_{bth} = 30.757 \%$$

→ Brake specific fuel consumption

$$\text{bsfc} = \frac{\text{mf}}{\text{B.P.}} = \frac{1.3 \times 10^3}{17.593} \times 3600 = \underline{\underline{0.266 \text{ kg/kW Hr}}} \\ \text{Ans!}$$

→ Mechanical efficiency

$$\eta_{\text{mech}} = \frac{\text{B.P.}}{\text{I.P.}} \times 100 \\ = \frac{17.593}{23.812} \times 100 = \underline{\underline{77.883}} \\ \text{Ans!}$$

*Check Calculation*

→ Indicated mean effective pressure

$$\text{imep} = \frac{\text{I.P.}}{\dot{V}_s} = \frac{23.812}{\dot{V}_s} \\ \text{Given} \\ D = 50 \text{ mm} = 0.05 \text{ m} \\ L = 70 \text{ mm} = 0.07 \text{ m} \\ N = 3200 \text{ rpm} \\ K = 4$$

$$\dot{V}_s = \frac{\pi}{4} D^2 L \times \frac{N \times K}{60 \times 2} \\ = \frac{\pi}{4} \times 0.05^2 \times 0.07 \times 3200 \times 4 \\ \underline{\underline{0.01466 \text{ m}^3/\text{s}}}$$

$$\dot{V}_s = 0.01466 \text{ m}^3/\text{s}$$

$$\Rightarrow \text{imep} = \frac{\text{IP}}{\dot{V}_s} = \frac{23.812 \times 10^3}{0.01466} = \underline{\underline{16.242 \text{ bar}}}$$

$$\boxed{\text{imep} = 16.242 \text{ bar}} \quad \text{Ans!}$$

bmeep = ?

Q.3 (a)

The steam at 7 bar saturated to a steam ejector water vapour refrigeration system. The temperature of the water in flash chamber is 5°C. Make up water is supplied at 20°C. The pressure in the condenser is 0.06 bar. The nozzle efficiency is 90%, the entrainment efficiency is 65% and the compression efficiency is 82%. Determine

- (i) Mass of motive steam required per kg of flashed vapour.
- (ii) Quality of flashed vapour from flash chamber.
- (iii) Refrigeration effect per kg of flash vapour.
- (iv) Mass of motive steam required per hour per ton of refrigeration.

Assume quality of mixture of motive steam and flashed vapour out the beginning of compression is 92% dry.

[Use Steam Tables attached at the end]

[20 marks]

2.3 (b)

An engine working on an Otto cycle having a compression ratio of 9, uses octane  $C_8H_{18}$  as a fuel. The lower heating value of the fuel is 44000 kJ/kg. The air fuel ratio is 14 : 1. Determine the maximum pressure and temperature reached in the cycle.

- (i) Without considering the molar expansion
- (ii) With molar expansion

Assume  $c_v = 0.71 \text{ kJ/kgK}$ , compression follows the law  $PV^{1.3} = \text{constant}$ , the pressure and temperature of the mixture at the beginning of the compression being 1.2 bar and 65°C respectively. Determine the percentage molecular expansion.

[20 marks]

Q.3 (c) A certain elastic balloon will support an internal pressure equal to  $P_0 = 100 \text{ kPa}$  until the balloon becomes spherical at a diameter of  $D_0 = 1 \text{ m}$ , beyond which

$$P = P_0 + C(1 - x^6)x; \quad x = \frac{D}{D_0}; \quad \text{because the offsetting effects of balloon curvature and elasticity.}$$

This balloon contains helium gas at 250 K, 100 kPa, with a  $0.4 \text{ m}^3$  volume. The balloon is heated until the volume reaches  $2 \text{ m}^3$ . During the process the maximum pressure inside the balloon is 200 kPa.

- (i) What is the temperature inside the balloon when pressure is maximum?
- (ii) What are the final pressure and temperature inside the balloon?
- (iii) Determine the work and heat transfer for the overall process.

[Take  $R_{He} = 2.077 \text{ kJ/kgK}$  and  $(C_V)_{He} = 3.1156 \text{ kJ/kgK}$ ]

[20 marks]

Q.4 (a) (i) Atmospheric air at  $35^{\circ}\text{C}$  and 60% RH is conditioned to  $22^{\circ}\text{C}$  DBT and 55% RH. This is done first by cooling and dehumidifying and then heating. If the quantity of air flow is  $50 \text{ m}^3$  per minutes. Find the following

1. Capacity of cooling air (in tons)
2. Capacity of heating coil (in kW)
3. Amount of water vapour added to the air per minute

Take  $P_t = 1.033 \text{ bar}$

[Use Steam Table attached at the end]

(ii) Define the term 'bypass' factor used for cooling or heating coil and find the expression for that.

**[15 + 5 marks]**

- Q.4 (b) (i) A mixture is composed of 3 mol of  $\text{CO}_2$  and 5 mol of  $\text{N}_2$ . It is compressed adiabatically in a cylinder from 110 kPa and 20°C to 2.2 MPa. Assuming constant specific heats for both the gases:

For  $\text{CO}_2$  take,  $c_v = 0.653 \text{ kJ/kgK}$  and  $c_p = 0.842 \text{ kJ/kgK}$

For  $\text{N}_2$  take,  $c_v = 0.745 \text{ kJ/kgK}$  and  $c_p = 1.042 \text{ kJ/kgK}$

Calculate :

1. The final temperature.
2. The work required.
3. The change in entropy.

- (ii) The moment of inertia of a flywheel is  $0.6 \text{ kg.m}^2$  and it rotates at a speed of 2100 rpm in a large insulated system at 18°C. The kinetic energy of the flywheel is distributed as frictional heat at the shaft bearings. The water equivalent of the shaft bearing is 0.8 kg. Find the rise in temperature of the shaft bearing when flywheel has come to rest. Determine the maximum possible heat which may return to the flywheel as high grade energy. Calculate how much amount of kinetic energy becomes unavailable. What would be the final rpm of the flywheel if it is set in motion with this available energy?

[10 + 10 marks]

Q.4 (c)

- (i) Discuss the various variables that affect the performance of an IC (Internal Combustion) engine. Also define scavenging efficiency, efficiency and combustion efficiency.
- (ii) A single cylinder 4-stroke diesel engine running at 1400 rpm uses 2.3 kg of fuel per hour of specific gravity 0.88. It has an open type injector with a single orifice nozzle and the injection period of  $25^\circ$  crank angle. If the average injection pressure is 135 bar and the average pressure inside the cylinder is 25 bar, estimate the diameter of the fuel orifice. [Assume  $c_d$  for the nozzle = 0.88]

**Section B : Thermodynamics + Refrigeration and Air-conditioning + IC Engine**

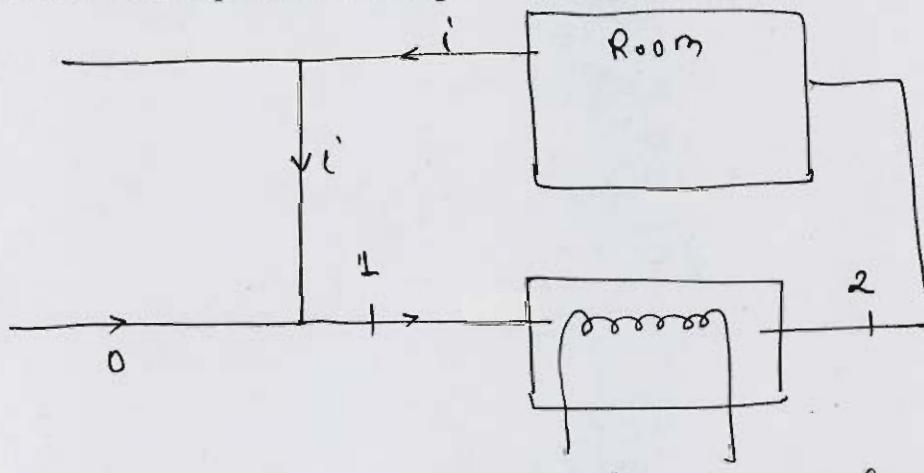

Q.5 (a) Draw a neat sketch of automatic expansion valve and explain its working.

[12 marks]

- Q.5 (b) Show a systematic sketch of summer air conditioning for Hot and Humid outdoor conditions and explain its working.

Sol:

[12 marks]

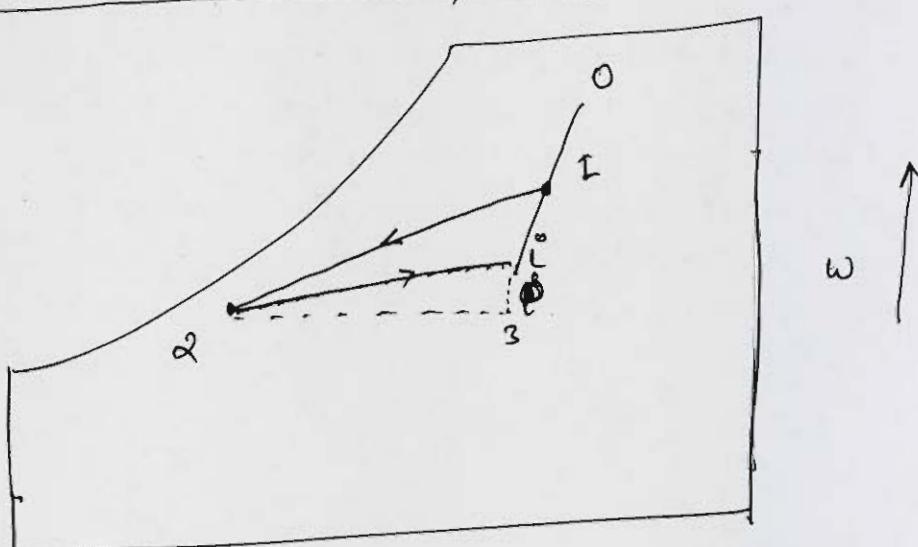

0 - outside air (ventilation)

i - inside air i.e. condition of room

1 - condition after mixing of outside air and inside air

2 - condition after conditioning of air supplied to room.

Process on Psychrometry chart

here,  $h_i - h_3 = \text{Room Latent heat}$

$h_3 - h_2 = \text{Room sensible heat}$

from the chart, it can be seen that  
process observed in summer air conditioning

is cooling + dehumidification.

here,  $w \downarrow$

$t \downarrow$

comfort ↑.

In Proper Explanation

- Q.5 (c) A single cylinder two stroke SI engine has 9 cm diameter bore and 12 cm stroke. The compression ratio is 9. The exhaust part opens 60° before BDC and closes 60° after BDC. The air/fuel ratio is 16 : 1. The temperature of the mixture entering into the engine is 300 K and the pressure in the cylinder at the time of closing the exhaust is 1 bar. The R for the mixture = 287 kJ/kgK. Air supplied to the engine is 180 kg/hr. The speed of the engine is 3800 rpm. Considering the effective stroke, calculate the scavenging ratio, the scavenging efficiency and the trapping efficiency.

[12 marks]

**Q.5 (d)** A closed rigid tank filled with water vapour, initially at 20.98 MPa, 633.22°C is cooled until its temperature reaches 439.03°C. Determine

- (i) the specific volume of the water vapour in  $\text{m}^3/\text{kg}$  at the initial state.
- (ii) the pressure in MPa at the final state

[Take molecular weight, critical temperature and critical pressure as 18.02 kg/Kmol, 647.3 K and 220.9 bar respectively]

[Use compressibility chart attached at the end]

**[12 marks]**

Q.5 (e)

A cylindrical copper rod of base area  $A$  and length  $L$  is insulated on its lateral surface. One end of the rod is in contact with a wall at temperature  $T_H$ . The other end is in contact with a wall at a lower temperature  $T_C$ . At steady state, the rate at which energy is conducted into the rod from hot wall is

$$\dot{Q}_H = \frac{kA(T_H - T_C)}{L}$$

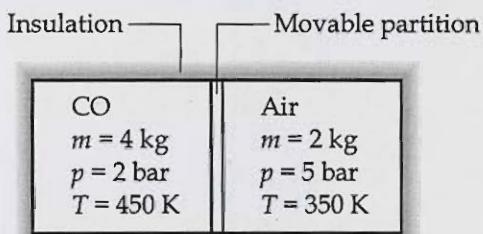

where  $K$  is the thermal conductivity of the copper rod.

- (i) For the rod as the system, obtain an expression for the time rate of entropy production in terms of  $A$ ,  $L$ ,  $T_H$ ,  $T_C$  and  $K$ .
- (ii) If  $T_H = 427^\circ\text{C}$ ,  $T_C = 127^\circ\text{C}$ ,  $k = 0.4 \text{ kW/mK}$ ,  $A = 0.1 \text{ m}^2$ , plot the heat transfer rate  $\dot{Q}_H$  in  $\text{kW}$ , and the time rate of entropy production in  $\text{kW/K}$ , each versus  $L$  ranging from 0.2 to 1 m.

[12 marks]

- 1.6 (a) Two kg of air, initially at 5 bar, 350 K and 4 kg of carbon monoxide (CO) initially at 2 bar, 450 K are confined to opposite sides of a rigid, well insulated container by a partition as shown in the figure. The partition is free to move and allows conduction from one gas to the other without energy storage in the partition itself. The air and CO each behave as ideal gases with constant specific heat ratio,  $\gamma = 1.395$ . Determine at equilibrium

- (i) The temperature (in K)
- (ii) The pressure (in bar)
- (iii) The volume occupied by each gas (in m<sup>3</sup>)

[20 marks]

- Q.6 (b) (i) List and explain the various losses that causes deviation of the actual internal combustion engine cycle from the ideal fuel-air cycle.
- (ii) A spark-ignition engine runs at 2200 rpm. The compression ratio is 8, the cylinder bore is 10 cm and the engine is square. Connecting rod length is 18 cm. The spark plug is offset by 2 cm from the centre. The spark plug is offset by 2 cm from the centre. The spark plug is fired at  $20^\circ$  bTDC. It takes  $7^\circ$  of engine rotation for the combustion to develop and get into flame propagation mode. Flame termination occurs at  $14^\circ$  aTDC. Calculate:
1. Piston displacement from TDC position at the time of flame termination.
  2. Flame travel distance.
  3. Effective flame speed.

[10 + 10 marks]

**Q.6 (c)** In a thermoelectric refrigeration system of 20 W cooling capacity,  $T_c = -15^\circ\text{C}$  and  $T_n = 40^\circ\text{C}$ . Both the diameter and length of *p*-type material are 0.01 m. The length of the *n*-type material is also 0.01 m. The properties of thermoelectric material are as follows:

$$\alpha_p = 0.00015 \text{ V/K} \text{ and } \alpha_n = -0.0002 \text{ V/K}$$

$$\sigma_p = 1000 \text{ cm}^{-1} \text{ Ohm}^{-1} \text{ and } \sigma_n = 1500 \text{ cm}^{-1} \text{ Ohm}^{-1}$$

$$k_p = k_n = 1.2 \text{ W/mK}$$

For figure of merit to be maximum

- (i) Find the area and the diameter of the *n*-type material, overall heat transfer coefficient  $U$ , the resistance  $R$  and the figure of merit  $z$ .
- (ii) Find the COP, the current, refrigeration effect, the number of thermocouple pairs and the power for the case of maximum COP and for the case of maximum cooling.

[20 marks]

**Q.7 (a)** A car showroom is air-conditioned for sensible load of 58 kW and latent load of 14 kW. The inside design conditions are 25°C DBT and 50% RH and outside design conditions are 36.5°C DBT and 26°C WBT. The fresh (ventilation) air supplied to the showroom is 75 m<sup>3</sup>/min. Determine

- (i) The ventilation load
- (ii) Total load to be taken by the plant
- (iii) Effective sensible heat factor
- (iv) Apparatus dew point
- (v) Dehumidified air quantity
- (vi) Conditions of air entering the apparatus.

Take bypass factor of cooling coil as 0.2.

[Use Psychrometric Chart attached at the end]

**[20 marks]**

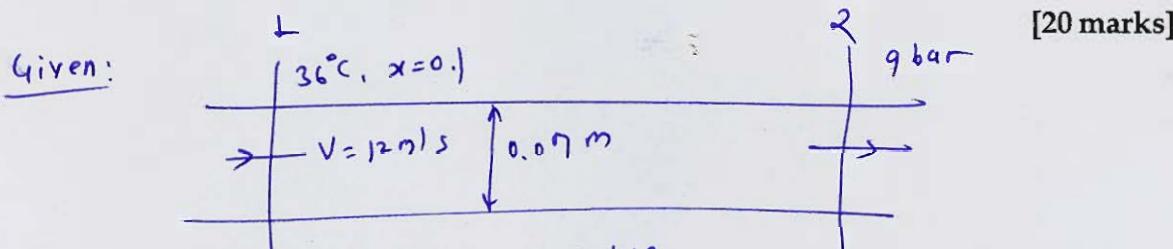

Q.7 (b)

Refrigerant 134a flows at steady state through a horizontal tube having an inside diameter of 0.07 m. The refrigerant enters the tube of quality of 0.1, temperature of 36°C, and velocity of 12 m/s. The refrigerant exits the tube at 9 bar as a saturated liquid. Determine

- The mass flow rate of the refrigerant, in kg/s.
- The velocity of the refrigerant at the exit.
- The rate of heat transfer, in kW, and its associated direction with respect to the refrigerant.

[Use Refrigerant Table attached at the end]

at L from Refrigerant table

$$\rho = 1163.4 \text{ kg/m}^3 \quad h_f = 250.48 \text{ kJ/kg}$$

$$v = 0.02238 \text{ m}^3/\text{kg} \quad h_g = 417.65 \text{ kJ/kg}$$

10

$$\Rightarrow h_1 = h_f + x(h_g - h_f)$$

$$= 250.48 + 0.1(417.65 - 250.48)$$

$$= 267.197 \text{ kJ/kg}$$

<u>at 2 - 9 bar or 0.9 MPa → saturated liquid</u>	
<u>p (MPa)</u>	<u>enthalpy (saturated liquid)</u>
0.85263	247.54
0.9	$h_2$
0.91185	250.48

→ by interpolation

$$\frac{h_2 - 247.54}{250.48 - 247.54} = \frac{0.9 - 0.85263}{0.91185 - 0.85263}$$

$$\Rightarrow h_2 = 249.8917 \text{ kJ/kg}$$

Crossponds to density  $\rho_1$

now

① mass flow rate

$$\dot{m} = \rho_1 A V_1 = 1163.4 \times \frac{\pi}{4} \times 0.07^2 \times 12$$

$$\boxed{\dot{m} = 53.727 \text{ kg/s}} \quad \text{Ans.}$$

② velocity at the exit

first we need to find density at the exit,

<u>Pressure (MPa)</u>	<u>Density (<math>\text{kg/m}^3</math>)</u>
0.85263	1171.6
0.9	$\rho_2$
0.91185	1163.4

$$\Rightarrow \text{by interpolation} \quad \frac{\rho_2 - 1171.6}{1163.4 - 1171.6} = \frac{0.9 - 0.85263}{0.91185 - 0.85263}$$

$$\boxed{\rho_2 = 1165.04 \text{ kg/m}^3}$$

$$\Rightarrow \therefore \rho_1 A V_1 = \rho_2 A V_2$$

$$1163.4 \times 12 = 1165.04 \times V_2$$

$$\Rightarrow V_2 = 12.0037 \text{ m/s} \quad \text{Ans.}$$

③ Heat transfer

by SFTC -  $\Rightarrow m_{\text{hit}} \phi = m b_2 + w$

$$\Rightarrow \phi = m(h_2 - h_1) = 53.727(249.8917 - 267.197)$$

$$\boxed{\phi = -929.762 \text{ kW}} \quad \text{Ans.}$$

i.e. Heat is lost by the system or refrigerant.

Q.7 (c) A test on a single-cylinder, four stroke oil engine having bore of 16 cm and stroke 32 cm gave the following results; speed 280 rpm; brake torque 200 Nm; indicated mean effective pressure 8 bar; fuel consumption 2.5 kg/hr; cooling water flow 6 kg/min; cooling water temperature rise 35°C; air fuel ratio 20; exhaust gas temperature 400°C; barometric pressure 1 bar; room temperature 20°C. The fuel has calorific value of 42 MJ/kg and contains 16% weight of hydrogen. Take latent heat of vaporisation as 2250 kJ/kg. Determine:

- Indicated thermal efficiency.
- Volumetric efficiency based on atmospheric conditions.

Draw up a heat balance in terms of kJ/min. Take  $c_p$  for dry exhaust gas = 1 kJ/kgK and super heated steam  $c_p = 2.1$  kJ/kgK;  $R = 0.287$  kJ/kgK.

[Assume that the exhaust steam is in superheated state]

Given: single cylinder 4 stroke engine

[20 marks]

$$\text{bore, } D = 16 \text{ cm} = 0.16 \text{ m}$$

$$\text{stroke, } L = 32 \text{ cm} = 0.32 \text{ m}$$

$$\text{speed} = 280 \text{ rpm}$$

$$\text{brake torque, } T_b = 200 \text{ Nm}$$

$$\text{imep} = 8 \text{ bar}$$

$$\dot{m}_f = 2.5 \text{ kg/hr}$$

$$\text{cooling water}$$

$$\dot{m}_{cw} = 6 \text{ kg/min}$$

$$\Delta T_{cw} = 35^\circ\text{C}$$

$$\text{air fuel ratio, } \dot{m}_a / \dot{m}_f = 20$$

$$T_{exhaust} = T_{ex} = 400^\circ\text{C}$$

$$\text{Room temp, } T_{oo} = 20^\circ\text{C}, P = 1 \text{ bar}$$

$$\text{Calorific value of fuel, } CV = 42 \text{ MJ/kg}$$

$$\text{fuel} \rightarrow 16\% \text{ of H}_2$$

$$\text{Latent heat of vaporisation} = 2250 \text{ kJ/kg} = LH$$

now) Theoretical swept volume

$$V_s = \frac{\pi}{4} D^2 L \times \frac{N \times K}{60 \times 2} = \frac{\pi}{4} \times 0.16^2 \times 0.32 \times 280 \times \frac{1}{60 \times 2}$$

$$V_s = 0.015012 \text{ m}^3/\text{s} = 0.90076 \text{ m}^3/\text{min}$$

Q.8 (a) A dual combustion cycle operates with a compression ratio of 13 and with a cut-off ratio of 1.65. The maximum pressure is 50 bar. The pressure and temperature before compression are 1 bar and 59°C respectively. Assuming indices of compression and expansion to be 1.35. Determine

- The temperatures at cardinal points.
- The cycle efficiency.
- The mean effective pressure of the cycle.

In:

Given: Dual Combustion cycle

[20 marks]

Now, 1-2  $\rightarrow \frac{T_2}{T_1} = \left(\frac{V_1}{V_2}\right)^{n-1} = 13^{1.35-1} = \frac{T_2}{332}$

$T_2 = 814.738 \text{ K}$  Ans!  $\frac{P_2}{P_1} = \left(\frac{V_1}{V_2}\right)^{\frac{n-1}{n}} = 13^{1.35}$

~~$P_2 = 31.902 \text{ bar}$~~

2-29  $\rightarrow$  constant volume process

$$\frac{T_{29}}{T_2} = \frac{P_{29}}{P_2} \Rightarrow \frac{T_{29}}{814.738} = \frac{50}{31.902}$$

~~$T_{29} = 1276.92 \text{ K}$~~  Ans!

29-3  $\rightarrow$  constant pressure process

$$\beta = \frac{V_3}{V_{29}} = \frac{T_3}{T_{29}} = 1.65 = \frac{T_3}{1276.92}$$

~~$T_3 = 2106.92 \text{ K}$~~  Ans!

$$\frac{3-4}{T_3} \rightarrow PV^{1.35} = C$$

$$\frac{T_3}{T_4} = \left( \frac{V_4}{V_3} \right)^{1.35-1} \rightarrow \frac{2106.92}{T_4} = \left[ \frac{V_1}{V_2} \right]^{1.35} = \left( \frac{13}{1.65} \right)^{1.35}$$

$$T_4 = 1023.03 \text{ K} \quad \text{Ans!}$$

Ans  $\neq 1.$   
Check  
me  
anwts

now,  
 $\Phi_{\text{supp.}} = C_V (T_{29} - T_2) + C_P (T_3 - T_{29})$   
 $= 0.718 (1276.92 - 814.738) + 1.005 (2106.92 - 1276.92)$   
 $= 1165.9966 \text{ kJ/kg}$

$$\frac{\text{Heat Rejected}}{\Phi_{\text{reg}}} = C_V (T_4 - T_1) = 0.718 \times [1023.03 - 332]$$

$$= 496.159 \text{ kJ/kg.}$$

⇒ Cycle efficiency

$$\eta_{\text{cycle}} = \left( 1 - \frac{\Phi_{\text{reg}}}{\Phi_{\text{supp.}}} \right) \times 100$$

$$= \left( 1 - \frac{496.159}{1165.9966} \right) \times 100 \rightarrow 1409.923$$

$$\eta_{\text{cycle}} = 57.48 \% \quad \text{Ans!}$$

⇒ mean effective pressure of cycle

$$\text{Wnet} = \Phi_{\text{supp.}} - \Phi_{\text{reg}}$$

$$= 1165.9966 - 496.159$$

$$= 669.8376 \text{ kJ/kg}$$

now, Assuming 100% volume toxic efficiency

$$\eta_{\text{vol}} = \frac{V_1}{V_2} = \frac{100}{100}$$

$$\Rightarrow V_s = V_a = \frac{RT_1}{P_1} = \frac{0.287 \times 332}{100} = 0.95284 \text{ m}^3/\text{kg}$$

$\Rightarrow$  we know,

$$W_{net} = P_{mean} \times V_s$$

$$669.8376 = P_{mean} \times 0.95284$$

$$P_{mean} = 702.99 \text{ kPa}$$

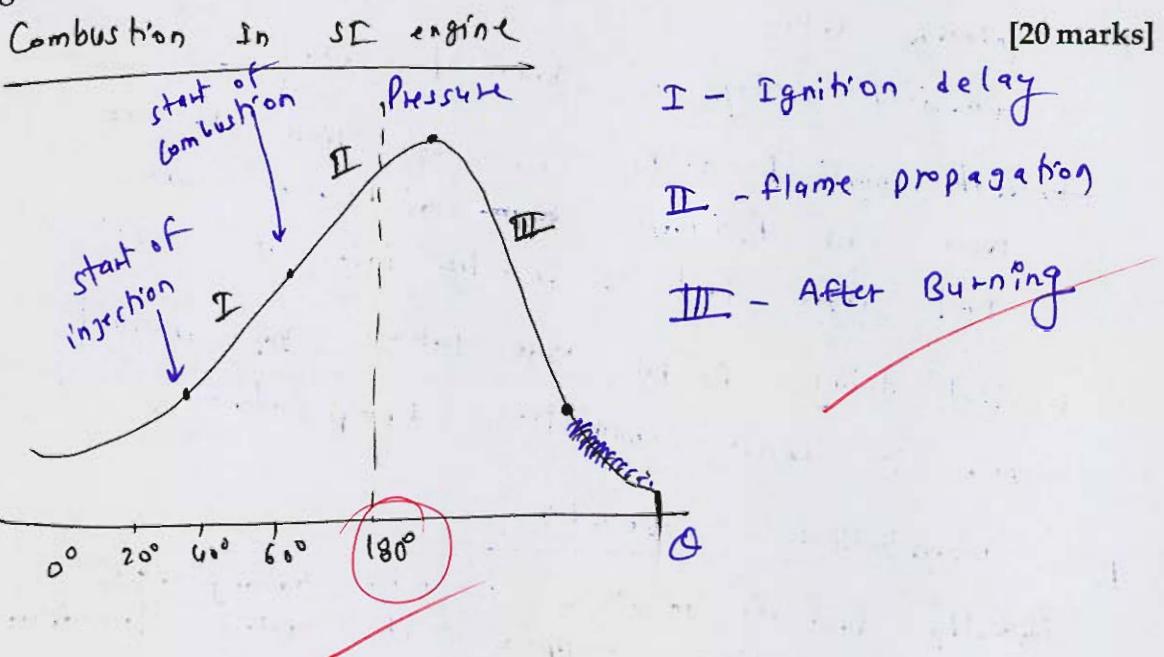

$$= 7.0299 \text{ bar}$$

Ans:

$$P_{mean} = 7.0299 \text{ bar}$$

Q.8 (b) Explain the stages of combustion in Spark Ignition (SI) and Compression Ignition (CI) engines.

Soln:

I - Ignition delay

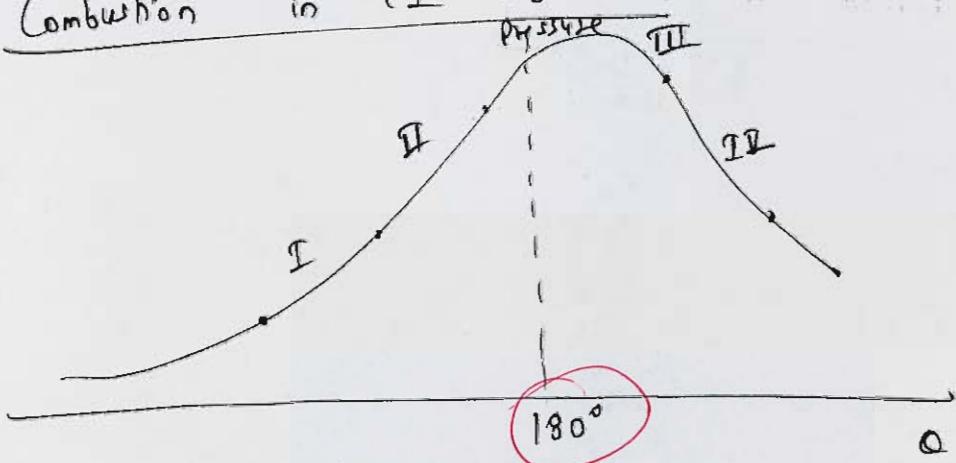

It is the time between start of injection & start of combustion. It consists of only chemical delay.

II - Flame propagation

It is the time when flame propagation starts till maximum pressure reached in cycle.

III - After Burning

Any combustion after achieving maximum pressure is after burning.

Combustion in CI engineI - Ignition delay

$$= \text{physical delay} + \text{chemical delay}$$

Physical delay is the time taken to form an ignitable mixture of air & fuel after fuel is injected into the cycle.

→ Chemical delay is the time taken by air-fuel mixture to reach combustion temperature.

II - Uncontrolled Combustion

Initially fuel-air mixture is not homogeneous & so combustion happens at various locations where fuel air mixture is homogeneous.

At few locations, more fuel gets collected which then burns suddenly, known as uncontrolled combustion.

④ III - Controlled Combustion

Once combustion is set up in the cylinder, smooth combustion is observed known as Controlled Combustion.

IV - After Burning

→ Combustion during the exhaust stroke when remaining fuel gets burned is known as after burning.

(12)

- Q.8 (c) (i) What are the design and operating variables which may decrease the formation of  $\text{NO}_x$  in the exhaust of an SI engine? Briefly explain the effect of injection timing, fuel/air ratio, type of fuel and intake air charge dilution on CI engine  $\text{NO}_x$  exhaust emission.
- (ii) The compression ratio of an engine working an Diesel cycle is 22 and the air/fuel ratio is 28 : 1. The temperature at the end of compression is 970 K. The calorific value of the fuel is 42000 kJ/kg and the specific heat at constant volume of the products of combustion is given by  $c_v = (0.74 + 25 \times 10^{-6}T)$  kJ/kgK and  $P = 0.287$  kJ/kgK. Determine the percentage of stroke at which combustion is complete.
